Logistics is generally the detailed organization and implementation of a complex operation. In a general business sense, logistics is the management of the flow of things between the point of origin and the point of consumption in order to meet requirements of customers or corporations. The resources managed in logistics may include tangible goods such as materials, equipment, and supplies, as ...1. Introduction. Engineering Asset Management (AM) as a discipline addresses the value contribution of AM to an organization's success (Amadi-Echendu et al., 2007). The AM system may be defined as: "the system that plans and controls the asset-related activities and their relationships to ensure the asset performance that meets the intended competitive strategy of the organization". Quality management ensures that an organization, product or service is consistent. It has four main components: quality planning, quality assurance, quality control and quality improvement. Quality management is focused not only on product and service quality, but also on the means to achieve it. Quality management, therefore, uses quality assurance and control of processes as well as products ...Management of end-to-end supply chain operations, encompassing logistics with 200 DCs/FCs, replenishment and flow, planning, forecasting, and food manufacturing for both e-Commerce and physical stores across 27 countries in Asia, Africa, Central America, South America, North America, and United Kingdom with over \$130B business
